

JavaRMI Application

This Java Remote Method Invocation (Java RMI) application demonstrates a simple e-commerce system with functionalities for administrators, customers, and products. It allows administrators to manage users and products, customers to interact with their shopping carts, and products to be managed within the system.

Files:

Administrator.java: Defines the Administrator class representing an administrator with attributes and methods for managing users and products.

AdministratorService.java: Defines the AdministratorService interface for remote methods related to administrator functionalities.

AdministratorServiceImpl.java: Implements the AdministratorService interface, providing the server-side logic for administrator functionalities.

Client.java: Contains the main method for client-side interaction, demonstrating the usage of services provided by the server.

Customer.java: Represents a customer with attributes and methods for managing their account and interactions with products.

CustomerService.java: Defines the CustomerService interface for remote methods related to customer functionalities.

CustomerServiceImpl.java: Implements the CustomerService interface, providing the server-side logic for customer functionalities.

Order.java: Defines the Order class representing an order placed by a customer, with associated products and status.

Product.java: Represents a product with attributes and methods for management and association with orders.

ProductService.java: Defines the ProductService interface for remote methods related to product functionalities.

ProductServiceImpl.java: Implements the ProductService interface, providing the server-side logic for product functionalities.

Server.java: Contains the main method to start the server and bind services to the registry.

ShoppingCart.java: Represents a shopping cart for a customer, allowing them to add, remove, and checkout products.

How to run:

Open terminal using the below command

```
1) ssh -p 1294 raettadi@in-csci-rrpc05.cs.iupui.edu
```

Now go to folder using below command
2) `cd Assignment3`

then navigate to store folder
3) `cd store`

then type below command
4) `make -f makefile.mak`

Now go to Assignment3 folder
5) `cd ..`

Type below command
6) `make -f store/makefile.mak server`

Open another terminal, follow steps 1 to 5 and the type below command

7) `make -f store/makefile.mak client`

And also creation of jar file for the application can be done using below commands

Create the JAR file
`jar cvf YourJarName.jar store/*.class`

Execute the server and client from the JAR file
`java -jar YourJarName.jar server`
`java -jar YourJarName.jar client`
